

QUICKSTART GUIDE

How to Clean and Disinfect with Prevail Concentrate

Step 1: Dilute Prevail™ Concentrate to the desired concentration

Can either be diluted with AHP[®] approved equipment or into a container.

AHP1750 Test Strips should be used regularly to confirm proper dilution.

SELECT YOUR DILUTION	ADD PREVAIL™ CONCENTRATE	ADD WATER
PRE-SOAK 1:128	32 mL	4 L
DISINFECTION 1:40 5 min contact time	100 mL	4 L

Step 2: Dry Clean (Remove Solid Waste)

Using a shovel or scraping tool, remove as much debris and organic material as possible, including feathers, manure, litter, feed, dust, dirt and cobwebs. Start at the top of the building and work down to the floors, from one end of the building to the other.

Step 3: Pre-soak (if required)

Pre-soak all surfaces and equipment with Prevail Concentrate, using a dilution of 32 mL concentrate per 4 L water (1:128). Apply from the bottom to top.

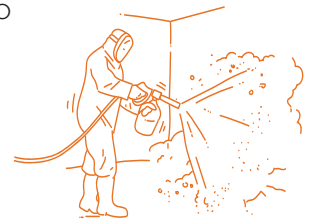

Step 4: Rinse with Water

Rinse with high pressure water (>1000 psi) working from top to bottom. Use hot water if available.

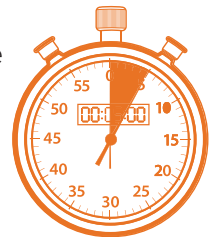

Step 5: Disinfect

Apply Prevail Concentrate to all surfaces and equipment, using a dilution of 100 mL concentrate per 4 L water (1:40). A foaming applicator is recommended. Using water and pressure from power washer lines, attach a foaming gun calibrated to deliver a 1:40 dilution. Move the foaming gun quickly and evenly, covering all surfaces and equipment with foam. Work from the bottom upward.

Step 6: Wait 5 Minutes

Wait for the required contact time of 5 minutes to be reached. No need to rinse or wait for surfaces to dry.
